

AI SOURCE INTEGRITY — QUICK REFERENCE CARD

PHAROS AI v1.0 | Run these 8 checks on every substantive AI claim before it enters the record.

1. Exact source title/author/year/journal or statute/article located via independent search.
2. DOI/URL/identifier resolves to the claimed document and it is the primary (not summary or press).
3. Direct quote or number matches verbatim in the source at the cited location (Ctrl+F).
4. Claim does not add scope, causation, universality, numbers, or interpretation absent from the source.
5. Source publication date predates AI generation; no post-cutoff or future-dated hallucination.
6. No authority-inflation language ('experts agree', 'establishes', 'requires', 'the literature is clear') beyond the source's own hedging.
7. At least one independent cross-check performed (different database, second primary, or adversarial lens).
8. For any non-Verified claim: provenance packet attached (excerpt + epistemic label + retrieval metadata + reviewer name/date).

7 Source Categories (downgrade if you cannot name exact doc + locator + retrieval date for Cat 1-4):

1 Primary peer-reviewed/journal • 2 Official statutes/regulations/standards • 3 Corporate primary records (filings, registries, FEC) • 4 Court/tribunal/admin decisions • 5 News/press/trade (secondary) • 6 Preprints/working papers/unreviewed • 7 Model-internal/uncited synthesis (Critical risk)

Epistemic Labels (4-tier rubric): VERIFIED (direct support, safe with citation) | INFERRED (logical extension, label explicitly) | PLAUSIBLE (weak support/gaps, flag prominently) | HALLUCINATED (no support or contradiction, reject).

Decision Rule: If you reach Plausible or Hallucinated, do not publish/file without explicit label + human sign-off accepting residual risk. Demand primary before drafting for Cat 1-4 claims that will be quoted, tabled, or used for liability/tax/public statements.
