

ACTOR Framework Worksheet

Praxis AI - Agent vs. Chatbot Decision Analysis

Instructions

Use this worksheet to systematically analyze whether your client scenario requires an AI agent or chatbot solution. Complete each section thoroughly, providing specific examples from your client's business context.

Client: Innovate Logistics

Use Case: Customer Service System

Analyst: _____

Date: _____

A - Autonomy Requirements

Question: Does the system need to operate independently without constant human oversight?

Analysis Prompts:

- Can the system handle inquiries during after-hours and peak seasons without human intervention?
- Are there scenarios where immediate action is required without waiting for human approval?
- How often do current customer inquiries require real-time decision-making?

Your Analysis:

None

Autonomy Score: ☐ Low (Human oversight required) ☐ Medium (Some independence) ☐ High (Full autonomy needed)

C - Complexity Assessment

Question: How many steps and variables are involved in typical interactions?

Analysis Prompts:

- Are most inquiries single-step (simple lookup) or multi-step (analysis and coordination)?
- Do solutions require gathering information from multiple sources?
- How many decision points are involved in resolving typical problems?

Your Analysis:

None

Complexity Score: ☐ Low (1-2 steps) ☐ Medium (3-4 steps) ☐ High (5+ steps with variables)

T - Tool Usage Required

Question: Must the system interact with external databases, APIs, or business systems?

Analysis Prompts:

- What business systems need to be accessed (warehouse, CRM, carrier APIs)?
- Are real-time calculations or optimizations required?
- Does problem-solving require coordinating between multiple platforms?

Clarification:

In this context, “tools” refers to any digital system, software, or service that the AI must actively use to complete a task. This includes:

- **Internal tools** (e.g., company databases, CRMs, knowledge bases)
- **External APIs** (e.g., shipping carrier tracking APIs, payment gateways)

- **Analytical or optimization engines** (e.g., inventory optimizers, pricing calculators, forecasting models)

The more the system must call, query, or interact with these tools to provide accurate and actionable outputs, the higher the tool usage requirements.

Systems Identification:

- Internal Systems Needed: _____
- External APIs Required: _____
- Calculation Tools Needed: _____

Your Analysis:

None

Tool Integration Score: ☐ Low (Minimal integration) ☐ Medium (Some systems) ☐ High (Multiple systems)

O - Outcome Variability

Question: Are there multiple valid solutions to typical problems?

Analysis Prompts:

- Do customer problems have standard solutions or require customized approaches?
- Are there multiple routing, timing, or service options to consider?
- How much does context (customer priority, seasonal factors) affect solutions?

Your Analysis:

None

Variability Score: ☐ Low (Standard solutions) ☐ Medium (Some options) ☐ High (Highly variable)

R - Reasoning Depth

Question: Does success require analysis, planning, and adaptation?

Analysis Prompts:

- Must the system analyze multiple factors to determine optimal solutions?
- Are there trade-offs (cost vs. speed, risk vs. reward) that require evaluation?
- Does the system need to adapt solutions based on changing conditions?

Your Analysis:

None

Reasoning Score: ☐ Low (Simple logic) ☐ Medium (Some analysis) ☐ High (Complex reasoning)

DECISION MATRIX

Scoring Guide:

- **3+ High scores:** Strong Agent Recommendation
- **2-3 Medium/High scores:** Agent Recommended
- **Mostly Low/Medium scores:** Chatbot May Suffice
- **All Low scores:** Chatbot Recommended

Component	Score	Weight	Notes
Autonomy	☐ L ☐ M ☐ H		
Complexity	☐ L ☐ M ☐ H		
Tool Usage	☐ L ☐ M ☐ H		
Outcome Variability	☐ L ☐ M ☐ H		
Reasoning Depth	☐ L ☐ M ☐ H		

RECOMMENDATION SUMMARY

Primary Recommendation: ☐ AI Agent ☐ Chatbot ☐ Hybrid Approach

Key Justification Points:

1.
2.
3.

Three Specific Tasks for Recommended System:

1.
2.
3.

Implementation Considerations:

None

Business Impact Projection:

None

VALIDATION CHECKLIST

- ☐ All ACTOR components analyzed with specific examples
- ☐ Scores align with business scenario complexity
- ☐ Recommendation supported by systematic analysis
- ☐ Three specific tasks identified for implementation
- ☐ Business justification connects to client value
