

Obsidian Agent Vault

10-Minute Setup Guide — memory layer for Claude Code and file-aware agents

What You Receive

A vault zip with four working layers (**raw/**, **wiki/**, **skills/**, **archive/**), five hub-note templates, a **CLAUDE.md** that loads your project context automatically, a **skill.md** template, and a synthesis prompt that converts raw captures into linked wiki notes.

```
vault/  
■■■ CLAUDE.md ← agent reads this first  
■■■ Home.md ← entry point for humans  
■■■ raw/ incoming captures, unprocessed  
■■■ wiki/ linked, durable knowledge  
■■■ skills/ reusable agent instructions  
■■■ archive/ completed or retired  
■■■ templates/ hub notes (project, person, concept ...)
```

Setup in 5 Steps

- 1. Unzip.** Put the folder somewhere stable. Your notes and agent files live here.
- 2. Open in Obsidian.** “Open folder as vault” → point to the unzipped folder.
- 3. Edit CLAUDE.md first.** Name, active projects, stack, preferences, standing rules. The agent reads this before anything else.
- 4. Use the folders on purpose.** Fresh captures → **raw/**. Durable knowledge → **wiki/**. Repeatable workflows → **skills/**. Done → **archive/**.
- 5. First retrieval loop.** Drop a real note in **raw/**, ask the agent to synthesize it into **wiki/**, confirm the result links back to a hub note.

“A note without links is stored text, not usable memory.”

How the Agent Works

The agent reads **CLAUDE.md** first, navigates linked wiki notes second, and falls back to raw material only when needed. Structure replaces search. Links replace re-pasting.

Success Check

You are set up when the agent can answer a project question without you re-explaining context, can follow links from a hub note to the right page, and can turn a raw note into a linked wiki note in one pass.

Recommended Next Moves

Add one hub note for your main project. Add one skill file for a repeated workflow. Add one plugin only if it clearly improves structure or search. Do not add complexity before the basic vault loop is working.

Template pack \$49 • Guided setup \$299 • Team implementation \$2,500
