

Obsidian Agent Vault — 10-Minute Setup Guide

Install the vault, load your context once, and give Claude Code or any file-aware agent a memory layer it can actually navigate.

What You Receive

Vault zip with **raw/**, **wiki/**, **skills/**, and **archive/**; hub-note templates; a **CLAUDE.md** starter; a **skill.md** template; and a synthesis prompt for turning raw notes into linked wiki notes.

Setup in 5 Steps

- 1. Unzip the vault.** Put the folder somewhere stable on your machine so your notes and agent files live in one place.
- 2. Open it in Obsidian.** Use “Open folder as vault” and point Obsidian to the unzipped folder.
- 3. Edit CLAUDE.md first.** Add your name, active projects, stack, preferences, and any standing rules the agent should always know.
- 4. Use the folders on purpose.** Put fresh captures in **raw/**; durable knowledge in **wiki/**; repeatable workflows in **skills/**; finished or stale material in **archive/**.
- 5. Create your first retrieval loop.** Drop one real note into **raw/**, ask the agent to synthesize it into **wiki/**, then make sure the result links back to a hub or project note.

How the Agent Should Work

The agent should read **CLAUDE.md** first, navigate through linked wiki notes second, and only fall back to raw material when needed. A note without links is stored text, not usable memory.

Success Check

You are set up when the agent can answer a project question without you re-pasting context, can follow links from a hub note into the right page, and can turn a raw note into a linked wiki note in one pass.

Recommended Next Moves

Add one hub note for your main project, one skill file for a repeated workflow, and one plugin only if it clearly improves structure or search. Do not add complexity before the basic vault loop is working.
