

Martin Packet System - Healthcare Providers

Limited Internal Circulation Reviewer Pack

Martin Lepage, PhD | [Pharos-ai.ca](#) | [infrafabric.io](#)

Research, applied control surfaces, and thirteen-pass recursive refinement

Generated UTC: 2026-03-17 02:38:00Z | Primary review surface: Compact reviewer pack | Current boundary: Limited internal circulation | Still blocked: Validation discharge and receipts

Abstract

This limited-internal-circulation reviewer pack merges the Martin packet system's research inputs, healthcare-provider control surface, claim registry, verification gates, and thirteen-pass recursion history into one formal review document. Run 13 resolved the first subdomain, named validation owner, discharge artifact type, and broader packet-family promotion ceiling. The live blocker is now validation discharge plus receipts rather than missing scope definition. This document is intended for serious internal review and does not claim validation discharge, client-facing readiness, clinical efficacy, regulatory readiness, or Martin-equivalent judgment.

Selected subdomain	Healthcare providers
Validation owner	Martin Lepage
Discharge artifact	Review Checklist

1. Current Black and White Read

The packet family is now much better specified than it was after Run 12. Martin has answered the key scope, owner, and promotion questions. The real blocker is now discharge, not definition.

Decision area	Current answer	Effect on the packet system
First healthcare subdomain	Healthcare providers	Scope is now concrete rather than generic.
Validation owner	Martin Lepage	Named human validator is now explicit.
Discharge artifact type	Review Checklist	Validation discharge now has a defined artifact.
Broader promotion boundary	Limited internal circulation	Packet family can circulate internally, but not outward as

Recursion-proof sharing	External reviewer ok	a healthcare/governance pack. Applies only to recursion/system- improvement evidence.
-------------------------	----------------------	--

- Validation discharge has not happened yet.
- Receipts for healthcare or governance claim support are not attached yet.
- Client-facing promotion remains blocked.
- Recursion proof may be shown externally, but that does not widen the broader healthcare or governance packet boundary.

2. Comparative Context

This pack is informed by two adjacent reference genres, but it should not be read as a ranking exercise. The FHIR paper contributes methods-paper seriousness, governance-as-infrastructure framing, and explicit limitation language. The FERZ note contributes chronology, lineage clarity, and terminology stability. Martin's packet family is distinct because it combines reviewer utility, claim-status discipline, explicit non-claims, and a retained human judgment boundary in one operating surface.

The table below is a condensed review surface derived from a fuller ten-dimension comparative matrix in the source packet. It is meant to orient a reviewer quickly, not to erase important qualifiers.

Dimension	FHIR reference	FERZ reference	Martin packet contribution
Primary function	Methods and infrastructure feasibility for clinical AI governance deployment	Clarification note and provenance record for recursive-cognition lineage	Evidence-bearing reviewer operating packet for review, control, and later domain adaptation
Opening posture	Formal paper sequence with abstract, methods, results, conclusions, and highlights	Archival status, chronology, constructs, registry, and citation guidance	Reviewer task, non-claims, evidence architecture, and handoff to Martin judgment

Evidence style	Simulation traces, explicit feasibility limits, and interoperable audit artifacts	Chronology, named constructs, references, and disclosure lineage	Source-backed evidence register plus separation of source, inference, and generated synthesis
Human boundary	Human oversight appears mainly in future workflow integration and override needs	Human authority retention appears as a named conceptual protocol	Predict, stage, prepare, flag, then wait for Martin
What it does not settle	Routine clinical deployment readiness, tamper-resistant integrity, and workflow fit	Runtime proof or operating reviewer workflow	Clinical efficacy, compliance readiness, or Martin-equivalent judgment

Current relative-strength concession: Martin's substrate is still weaker on polished figure and table presentation than the FHIR paper, and still weaker on chronology and registry completeness than the FERZ note. Its current distinct strength is reviewer utility, claim-status discipline, warning and override framing, and substantiation-versus-judgment separation.

3. Operating Packet System

The document family now behaves like a controlled reviewer system rather than a loose essay stack. Research inputs feed comparative context and healthcare control. Those in turn feed the claim registry, verification gates, and the compact reviewer pack that now serves as the primary endpoint.

- Comparative context keeps the editorial posture neutral.

- Healthcare control carries the owner, checklist, receipts, and promotion ceiling.
- Claim registry separates allowed-now, blocked-now, and not-claimed surfaces.
- Verification gates and freshness rules make contradiction handling replayable rather than ad hoc.

Verification gates are the bounded rerun surfaces a skeptical reviewer can use instead of trusting summary prose. Freshness and demotion rules decide which packet wins if an older surface conflicts with a newer owner packet. Together they keep the pack reviewable rather than merely well written.

4. Healthcare Providers Control Surface

The subdomain is now Healthcare providers. Martin Lepage is the named human validator. Review Checklist is the discharge artifact type. Those decisions matter because they convert the old ambiguity problem into a specific validation workflow problem.

Requirement	State	Owner	What closes it
Subdomain chosen	Pass	Martin	Already anchored as Healthcare providers
Validation owner named	Pass	Martin	Already anchored as Martin Lepage
Discharge artifact named	Pass	Martin	Already anchored as Review Checklist
Completed checklist exists	Blocked	Martin Lepage	Checklist completed and explicitly

Martin packet system | limited internal circulation

Receipts exist	Blocked	Martin Lepage	dispositioned Receipts attached for healthcare or governance claim support
Promotion boundary defined	Pass	Martin	Already anchored as limited internal circulation
Recursion-proof sharing defined	Pass	Martin	Already anchored as external reviewer ok
Client-facing promotion	Blocked	Martin	Later explicit promotion artifact

Hard stop: stop this lane immediately if any packet makes healthcare or governance claims without a named human validator and receipts.

5. Thirteen-Pass Recursive Improvement

The value of the recursion cycle is not that it magically resolves blocked decisions. Its value is that it makes the packet family more governable, more reviewable, and harder to overclaim from. Run 13 then converted Martin's answers into a live decision anchor rather than leaving them as missing prerequisites.

1. Runs 1 through 4 built the initial comparative, healthcare, and governance substrate.
2. Runs 5 through 8 hardened freshness, demotion, claim registry, verification, and ownership logic.

3. Runs 9 through 12 added adversarial review, a compact reviewer pack, and a tighter merged packet-system surface.
4. Run 13 resolved the subdomain, owner, discharge-artifact type, and promotion-boundary questions.

Note on source versions: the cited Run 12 recursion ledger still says some items were blocked before Run 13 existed. For current-state questions, read that ledger together with the Run 13 decision record and packet-system v4, which supersede the old subdomain and ownership blocker language.

6. How A Serious Reviewer Should Use This Pack

This document is a guided front door, not a substitute for the owner packets. It is designed to route a reviewer quickly to the right underlying surface.

Question	Canonical packet	What it answers
What changed most recently?	<code>martin_packet_system_v4.md</code>	Updated gate read after Martin's answers
What exactly did Martin decide?	<code>martin_decision_record_v1.md</code>	Canonical decision anchor
Has validation been discharged?	<code>healthcare_control_packet_v2.md</code>	No; checklist and receipts remain open
What may be claimed now?	<code>claim_registry_v2.md</code>	Allowed-now, blocked-now, and not-claimed state
What can a reviewer rerun?	<code>replayable_verification_gates_v1.md</code>	Bounded checks instead of trust in summary prose
Which older surfaces demote if newer ones disagree?	<code>freshness_and_demotion_contract_v1.md</code>	Conflict resolution and supersession logic
How should a hostile reviewer test this?	<code>adversarial_review_packet_v1.md</code>	Skeptical challenge surface

Adversarial review matters here because the pack is meant to survive skeptical questions. The adversarial packet names the strongest fair attacks and helps a reviewer test for overclaim, contradiction, and weak evidence routing.

7. Remaining Boundary and Next Moves

- Complete the Review Checklist and record Martin Lepage's disposition.
- Attach receipts for any healthcare or governance claim support that needs validation.

- Keep the broader packet family at limited internal circulation until those conditions are met.
- Treat any future client-facing promotion as a separate explicit decision, not as an implied consequence of Run 13.

The packet family is ready for limited internal circulation now. It is not yet validation-discharged, and this document does not claim otherwise.

Appendix A. Canonical Artifact Set

Version note: recursion_ledger_v4.md covers runs 5 through 12 only. Its older blocker list is partially resolved by the Run 13 decision record and martin_packet_system_v4.md.

Appendix B. Non-Claims

- This document is not a clinical efficacy study.
- This document is not a regulatory readiness memo.
- This document is not a compliance-grade runtime trust claim.
- This document does not substitute for Martin's judgment.
